A digital image is a two-dimensional function $f(x, y)$, where x and y denote spatial coordinates, and the function value corresponds to the intensity or color at a particular point. These images are composed of pixels, which are tiny picture elements, each carrying specific intensity or color information.

Grayscale images: Contain intensity information only, typically represented with 8 bits per pixel (256 levels of gray).

Color images: Usually composed of three color channels (RGB), each with its own grayscale image.

Basic Image Processing Steps

Gonzalez's text identifies several essential steps in processing images:

- Image Acquisition:** Capturing the image via sensors or cameras.
- Preprocessing:** Improving image quality via noise reduction, contrast enhancement.
- Segmentation:** Partitioning an image into meaningful regions.
- Representation and Description:** Extracting features for analysis.
- Recognition and Interpretation:** Assigning labels or meanings to objects within the image.

Image Enhancement and Restoration

Enhancing Image Quality

Image enhancement aims to improve visual appearance or to prepare images for further analysis. Techniques include:

- Spatial filtering:** Using convolution with specific kernels to emphasize or suppress features.
- Histogram equalization:** Improving image contrast by redistributing intensity values.
- Sharpening:** Highlighting edges and fine details for clearer images.

Gonzalez emphasizes the importance of selecting the right filter for the task, whether it's

smoothing noisy images or accentuating edges to facilitate segmentation. Restoring Degraded Images Restoration involves reversing the effects of image degradation caused by noise, blur, or other distortions. This section covers: Inverse filtering, which attempts to undo degradation mathematically. Wiener filtering, a more advanced method that accounts for noise statistics. Blind deconvolution, used when the degradation function is unknown. These techniques require a solid understanding of the degradation process and are critical in fields like astronomy and medical imaging where clarity is paramount. Image Segmentation Techniques Segmentation divides an image into regions of interest, such as objects, backgrounds, or textures. Gonzalez categorizes segmentation methods into: Thresholding: Separating objects based on intensity levels. Edge detection: Identifying boundaries via gradient-based operators like Sobel or Canny. Region-based segmentation: Grouping pixels based on similarity criteria. Clustering methods: K-means and fuzzy c-means algorithms for partitioning pixel data. The second edition expands on the advantages and limitations of each, providing practical insights into their applicability in real-world scenarios. Morphological Image Processing Morphological operations analyze geometrical structures within images, often used in binary images but extendable to grayscale images. Key operations include: Dilation: Expanding object boundaries. Erosion: Shrinking objects. Opening and closing: Combining dilation and erosion for noise removal or object smoothing. These tools are invaluable in preparing images for object recognition or measurement. Color Image Processing Color images introduce additional complexity due to multiple channels. Color image enhancement: Techniques to improve color fidelity or highlight features. Understanding how to manipulate color data is crucial for applications like digital photography, video processing, and remote sensing. Image Compression Efficient storage and transmission of images are vital given the large data sizes involved. The book covers: Lossless compression: Methods like Huffman coding and Run-Length Encoding, preserving image quality. Lossy compression: Techniques such as JPEG, which reduce data size by approximating image data, often with minimal perceptible loss. Gonzalez emphasizes balancing quality and compression ratio, especially relevant in bandwidth-constrained environments. Image Analysis and Understanding Feature Extraction Extracted features serve as the basis for recognition tasks. Techniques include: Edge, corner, and blob detection Texture analysis using statistical or spectral methods Shape analysis for object recognition Object Recognition Recognizing objects within images involves matching extracted features to known models.
