Check Bed Temperature: Monitor bed temperature sensors to ensure temperature is rising steadily without hotspots.
Supply Fuel: Introduce fuel gradually into the bed, ensuring even distribution to prevent localized overheating or unburned fuel accumulation.
Adjust Airflow: Fine-tune primary and secondary air flows to achieve stable combustion conditions. Typically, secondary air is introduced after the bed is heated adequately.
- 2. Achieving Steady-State Operation**
Once the initial startup steps are completed:
Monitor Combustion Parameters: Keep an eye on bed temperature, excess air ratio, flue gas composition, and bed pressure.
Increase Combustion Intensity: Gradually increase fuel feed rate while maintaining stable bed temperature and combustion efficiency.
Stabilize Flue Gas Emissions: Ensure emissions are within permissible limits, adjusting air flow and fuel feed as needed.
Activate Electrostatic Precipitators or Bag Filters: Once combustion is stable, activate particulate removal systems to control dust emissions.
Monitor Instrumentation: Confirm all control systems are functioning correctly and calibrate if necessary.
- 3. Final Checks and Transition to Normal Operation**
Before declaring the boiler ready for continuous operation:
Verify that all safety interlocks are engaged and operational.
Confirm that temperature and pressure readings are within normal ranges.
Ensure that ash removal systems are functioning properly.
Document all startup parameters and ensure proper log entries are made.

Safety Considerations During Startup

- 1. Personal Safety**
Ensure all personnel involved are trained and aware of safety protocols. Use appropriate personal protective equipment (PPE) such as helmets, gloves, eye protection, and respiratory masks.
- 2. System Safety**
Never bypass safety interlocks or safety valves. Control the rate of fuel addition to prevent sudden pressure surges or bed instability. Maintain communication among the startup team to coordinate actions smoothly.
- 3. Emergency Procedures**
Be prepared to shut down the boiler quickly if abnormal conditions such as excessive temperature, pressure, or abnormal vibrations occur. Have fire fighting equipment ready and personnel trained in emergency response.

Troubleshooting Common Startup Issues

- 1. Bed Instability or Poor Fluidization**
Adjust primary air flow to improve fluidization. Ensure bed material is evenly distributed. Check for obstructions or blockages in air ducts.
- 2. Inadequate Combustion or Flame Out**
Increase fuel feed gradually. Optimize secondary air flow for better oxidation. Check for fuel quality or moisture content issues.
- 3. Excessive Emissions or Temperature Fluctuations**
Adjust air-to-fuel ratio to improve combustion efficiency. Inspect and clean soot blowers, filters, and emission control devices. Ensure sensors and control systems are calibrated accurately.
