The Endocrine System

The endocrine system is a network of glands that produce hormones regulating various physiological processes. In Bio 164, students examine hormone synthesis, secretion, mechanisms of action, and systemic effects.

Major Endocrine Glands and Their Functions

- Pituitary Gland (Hypophysis):** Often termed the "master gland," it secretes hormones influencing growth (growth hormone), metabolism (thyroid-stimulating hormone), reproductive functions (luteinizing hormone, follicle-stimulating hormone), and water balance (antidiuretic hormone).

- Gonads (Ovaries and Testes):** Produce sex hormones (estrogen, progesterone, testosterone) critical for reproductive functions.

Hormonal Regulation and Feedback Loops

The endocrine system relies heavily on negative feedback mechanisms to maintain hormonal balance. For example, increased thyroid hormone levels inhibit TSH secretion from the pituitary, maintaining homeostasis. The hypothalamus and pituitary form a central regulatory axis controlling other endocrine glands.

The Cardiovascular System

The cardiovascular system is integral to transporting nutrients, oxygen, hormones, and waste products. Bio 164 covers the anatomy of the heart, blood vessels, and blood components, along with their physiological roles.

Heart Anatomy and Function

The heart comprises four chambers: two atria and two ventricles. The right side pumps deoxygenated blood to the lungs (pulmonary circulation), while the left side pumps oxygenated blood to systemic tissues. The heart's conduction system (SA node, AV node, bundle of His, Purkinje fibers) coordinates rhythmic

contractions. Blood Vessels and Circulation Arteries: Carry blood away from the heart; characterized by thick muscular walls. Veins: Return blood to the heart; contain valves to prevent backflow. Capillaries: Site of nutrient, gas, and waste exchange; thin-walled and highly permeable. Circulatory Pathways: Pulmonary Circulation: Right ventricle → lungs → left atrium. Systemic Circulation: Left ventricle → body tissues → right atrium. Blood Composition and Functions Erythrocytes (Red Blood Cells): Transport oxygen via hemoglobin. Leukocytes (White Blood Cells): Defend against pathogens. Platelets: Facilitate blood clotting. Plasma: Transports nutrients, hormones, and waste. Cardiovascular Disorders Hypertension, atherosclerosis, myocardial infarction, arrhythmias, and heart failure are discussed in terms of pathology and prevention. The Respiratory System This system ensures gas exchange? oxygen intake and carbon dioxide removal. Bio 164 emphasizes respiratory anatomy, mechanics, and regulatory control. Respiratory Anatomy The conducting zone includes the nasal cavity, pharynx, larynx, trachea, bronchi, and bronchioles. The respiratory zone comprises alveoli, where gas exchange occurs. The diaphragm and intercostal muscles facilitate breathing. Mechanics of Breathing Inhalation involves diaphragm contraction, thoracic cavity expansion, and negative pressure drawing air in. Exhalation is typically passive, driven by elastic recoil, but can be active during strenuous activity. Gas Exchange and Transport Occurs across alveolar-capillary membranes. Oxygen binds to hemoglobin; carbon dioxide is transported via plasma, hemoglobin, and as bicarbonate ions. Regulation of Respiration Controlled primarily by the medulla oblongata and pons. Chemoreceptors detect changes in blood CO₂, O₂, and pH levels, adjusting breathing rate accordingly. Respiratory Disorders Asthma, chronic obstructive pulmonary disease (COPD), pneumonia, and pulmonary embolism are examined with respect to causes and treatments. The Lymphatic and Immune Systems These systems protect the body from pathogens and facilitate fluid balance. Lymphatic Structures and Functions Lymphatic vessels collect excess interstitial fluid, returning it to the bloodstream. Lymph nodes filter lymph, trapping pathogens and debris. Other structures include the spleen, thymus, tonsils, and Peyer's patches. Immune Response Overview The immune system distinguishes self from non-self via innate and adaptive immunity. Key cells include macrophages, T lymphocytes, B lymphocytes, and natural killer cells. Types of Immunity Innate Immunity: Rapid, nonspecific defense mechanisms. Adaptive Immunity: Specific responses involving memory (e.g., antibodies). Disorders of the Immune System Autoimmune diseases, allergies, immunodeficiency disorders like HIV/AIDS. The Digestive System Responsible for nutrient breakdown, absorption, and waste elimination. Digestive Anatomy Main organs include the mouth, esophagus, stomach, small intestine, large intestine, rectum, and anus. Accessory organs include the liver, gallbladder, and pancreas. Digestive Processes Mechanical digestion: Chewing, churning. Chemical digestion: Enzymatic breakdown of macromolecules. Absorption: Nutrients pass into blood or lymph.
