Sample Questions and Model Approaches

Sample Question 1: Data Interpretation

Question: The table below shows the effect of pH on enzyme activity. Analyze the data and explain why enzyme activity decreases at pH 4 and pH 9.

pH	Enzyme activity (units)
4	20
5	50
6	80
7	100
8	80
9	40

Approach: Identify maximum activity at pH 7. Explain that enzymes have an optimal pH where their structure functions best. Deviations from this pH cause denaturation or altered active sites, reducing activity. At pH 4 and 9, the enzyme's structure is affected, leading to decreased activity.

Sample Question 2: Designing an Experiment

Question: Design an experiment to investigate the effect of light intensity on the rate of photosynthesis in pondweed.

Approach: Independent variable: Light intensity (using different distances from a light source). Dependent variable: Rate of photosynthesis (measured by oxygen bubbles produced per minute). Control variables: Temperature, CO₂ concentration, type of pondweed, duration of exposure. Method: Place pondweed in water, vary light distance, record oxygen bubbles over set time. Include safety and repeat measurements for reliability.

Sample Question Analysis from the 2013 Paper

Example Question: The graph shows the effect of temperature on enzyme activity. Describe the trend shown and explain why enzyme activity decreases at high temperatures.

Expert Explanation: The graph demonstrates that enzyme activity increases with temperature up to an optimum point, after which it declines sharply. This trend indicates that enzymes are more active at higher temperatures due to increased kinetic energy,

resulting in more frequent collisions with substrate molecules. However, beyond the optimum temperature, enzymes begin to denature, losing their specific shape, and thus their activity decreases. The sharp decline reflects the loss of enzyme function due to denaturation at elevated temperatures.

Key Points in Answer: Identification of the increasing trend up to the optimum point. Explanation of kinetic energy and collision frequency. Clarification of enzyme denaturation at high temperatures. Use of technical terms like 'denaturation,' 'active site,' and 'kinetic energy' enhances clarity.
