Sample "Check Your Understanding" Questions with Answers

To illustrate how to approach and answer these questions, here are some common examples along with detailed solutions.

Question 1: Explain how the structure of a plant cell differs from that of an animal cell.

Answer: Plant cells and animal cells have several key structural differences:

- Cell Wall:** Plant cells have a rigid cell wall made of cellulose that provides support and protection, whereas animal cells lack a cell wall.
- Chloroplasts:** Plant cells contain chloroplasts, which are responsible for photosynthesis. Animal cells do not have

chloroplasts. Vacuoles: Plant cells typically have a large central vacuole that maintains turgor pressure and stores nutrients. Animal cells may have small vacuoles or none. Shape: Due to the cell wall, plant cells generally have a fixed rectangular shape, while animal cells are more rounded and flexible. Diagram: Include a labeled diagram comparing plant and animal cells, highlighting the structures mentioned.

Question 2: Describe the process of photosynthesis and its importance to life on Earth. **Answer:** Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. The overall process can be summarized as: $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$

Steps: Light Absorption: Chlorophyll absorbs sunlight, providing energy. Light-Dependent Reactions: Convert light energy into chemical energy (ATP and NADPH). Calvin Cycle: Use ATP and NADPH to fix carbon dioxide into glucose. Importance: Produces oxygen necessary for most aerobic organisms. Forms the base of the food chain. Regulates atmospheric CO_2 levels, impacting climate. Include a diagram depicting the process within a chloroplast.

Question 3: Calculate the density of a substance given its mass and volume. **Answer:** Given: Mass = 50 grams Volume = 25 cm^3 Calculation: Density = Mass / Volume = $50\text{ g} / 25\text{ cm}^3 = 2\text{ g/cm}^3$ Explanation: Density is a measure of how much mass is contained in a given volume. This calculation helps identify the substance and compare it to known densities.

Sample "Check Your Understanding" Questions and Answers

To illustrate the approach, here are sample questions from BC Science 10, along with comprehensive answers that demonstrate the expected level of detail.

Example 1: Biology ? Photosynthesis

Question: Explain the process of photosynthesis and its significance to life on Earth.

Answer: Photosynthesis is a biochemical process carried out primarily by green plants, algae, and certain bacteria. It involves converting light energy from the sun into

chemical energy stored in glucose molecules. The overall simplified equation for photosynthesis is: $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$. In this process, chlorophyll within chloroplasts absorbs sunlight, providing the energy needed to drive chemical reactions. Carbon dioxide from the atmosphere enters the plant through stomata and combines with water absorbed by roots. Through a series of light-dependent and light-independent reactions (Calvin cycle), glucose is synthesized, serving as an energy reserve. The oxygen produced as a byproduct is released into the atmosphere. Photosynthesis is vital because it forms the foundation of most food chains and regulates atmospheric oxygen and carbon dioxide levels.

Example 2: Chemistry ? Balancing Chemical Equations
Question: Balance the following chemical equation: $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$
Answer: To balance the equation, count the atoms of each element on both sides:
Unbalanced: $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$
Atoms: Carbon (C): 1 on both sides; Oxygen (O): 2 on the left (O_2), 2 on the right (CO_2). Since the number of C and O atoms are already balanced, the equation is balanced as written: $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$. Therefore, the balanced chemical equation is: $\text{C} + \text{O}_2 \rightarrow \text{CO}_2$. This indicates that one carbon atom reacts with oxygen molecules to produce carbon dioxide.

Example 3: Physics ? Newton's Second Law
Question: A 10 kg object accelerates at 3 m/s^2 . What is the net force acting on it?
Answer: According to Newton's Second Law: $\text{Force (F)} = \text{mass (m)} \times \text{acceleration (a)}$. Plugging in the values: $F = 10 \text{ kg} \times 3 \text{ m/s}^2 = 30 \text{ N}$. Answer: The net force acting on the object is 30 newtons in the direction of acceleration.

The Role of "Check Your Understanding" Answers in Academic Success
 Access to accurate and detailed answers enhances the learning process by: Reinforcing correct understanding; Clarifying misconceptions; Building confidence before final assessments. However, students should be cautious not to rely solely on memorization. Instead, they should strive to understand the reasoning behind each answer, which fosters critical thinking and problem-solving skills essential for scientific literacy.
