Common ChemCad 6 Solved Examples

Below are several examples demonstrating typical applications of ChemCad 6, complete with step-by-step solutions.

Example 1: Simple Distillation Column

Problem Statement: Design a distillation column to separate a mixture of 50 mol% ethanol and 50 mol% water. Feed flow rate is 100 kmol/hr at 1 atm, with a desired top product of 95 mol% ethanol and bottom product of 5 mol%. Determine the reflux ratio and total number of stages.

Solution Steps:

- Set Up the Process Flow Diagram:** Use a feed stream at specified conditions. Add a distillation column module. Specify feed stage, condenser, and reboiler locations.
- Input Material Properties:** Define ethanol-water mixture using appropriate thermodynamic model (e.g., NRTL).
- Define Operating Conditions:** Feed composition, flow rate, pressure, and temperature. Specify product compositions for top and bottom streams.
- Run the Simulation:** ChemCad calculates the equilibrium stages, reflux ratio, and other parameters.
- Analyze Results:** Check the number of theoretical stages and the reflux ratio. Adjust parameters if necessary for optimization.

Key Results: Reflux ratio: approximately 2.5. Number of stages: around 15 (depending on the thermodynamic model accuracy).

Note: This example demonstrates how ChemCad simplifies complex distillation calculations by integrating thermodynamics and mass transfer models.

Example 2: Heat Exchanger Network Design

Problem Statement: Design a heat exchanger network where hot oil at 200°C heats a feed stream from 30°C

to 80°C, and the cooled oil exits at 150°C. The feed flow rate is 50 kg/hr, and the specific heat capacity is 2.1 kJ/kg·K.

Solution Steps:

- Model the Hot and Cold Streams:** Create streams with specified temperatures, flow rates, and heat capacities
- Add Heat Exchanger Module:** Connect hot and cold streams to the exchanger
- Calculate Heat Duty:** Use $Q = m \times C_p \times \Delta T$ for both streams
- Set Heat Transfer Parameters:** Input calculated duty into ChemCad's heat exchanger module
- Optimize the Design:** Adjust flow rates or temperatures to meet process requirements

Results: Heat duty required: $50 \text{ kg/hr} \times 2.1 \text{ kJ/kg}\cdot\text{K} \times (80^\circ\text{C} - 30^\circ\text{C}) = 5,250 \text{ kJ/hr}$

The cooled oil exiting at 150°C can be used elsewhere, or further cooling can be integrated. This example illustrates how ChemCad handles heat exchange calculations and network optimization efficiently.

Example 3: Reactor Design and Conversion Calculation

Problem Statement: Simulate a continuous stirred-tank reactor (CSTR) converting A to B with a first-order reaction rate of $k=0.1 \text{ min}^{-1}$. Feed contains 1 mol/min of A at 25°C and 1 atm. Determine the reactor volume needed to achieve 80% conversion.

Solution Steps:

- Set Up the Reactor Module:** Select a CSTR block in ChemCad
- Input Feed Conditions:** Flow rate, temperature, pressure, and composition
- Define Reaction Kinetics:** Enter reaction rate parameters into the reactor module
- Specify Conversion Goal:** Set target conversion of 80%
- Calculate Reactor Volume:** Use the first-order reaction equation: $V = (F_{A0} \times X) / (k \times (1 - X))$ Where F_{A0} = molar flow rate of A, X = conversion

Calculation: $V = (1 \text{ mol/min} \times 0.8) / (0.1 \text{ min}^{-1} \times 0.2) = 4 \text{ mol} / (0.02 \text{ mol/min}) = 200 \text{ min}$

Since the molar flow rate is 1 mol/min, the volume is proportional to the residence time, leading to a reactor volume corresponding to a residence time of 200 minutes.

Results: Reactor volume: approximately 200 liters (assuming ideal conditions and unit conversions)

This example demonstrates the integration of reaction kinetics with process simulation in ChemCad.

Advanced Applications and Troubleshooting with ChemCad 6

While the above examples cover fundamental processes, real-world applications often involve complexities like multistage distillation, heat integration, and dynamic simulations.
