This article explores the major internal organs, their functions, and their anatomical positions within the rabbit's body, providing a comprehensive overview that is both educational and accessible.

Overview of Rabbit Anatomy The rabbit's internal anatomy consists of several vital systems working harmoniously to sustain life. These include the digestive system, respiratory system, circulatory system, reproductive system, nervous system, and excretory system. During dissection, these organs are carefully exposed, identified, and labelled to facilitate understanding of their structure and function.

Major Internal Organs of a Dissected Rabbit The primary internal organs in a dissected rabbit can be categorized into various systems:

- Digestive organs
- Respiratory organs
- Circulatory organs
- Reproductive organs
- Excretory organs
- Nervous system components

Below is a detailed description of each system's organs with their labels.

- 1. Digestive System** The digestive system in a rabbit is responsible for processing food, absorbing nutrients, and eliminating waste. The key organs include:
 - Stomach** ? Located in the upper left abdominal cavity, it is a sac-like organ where initial digestion occurs.
 - Small Intestine** ? A long, coiled tube where most nutrient absorption happens. It consists of three parts: duodenum, jejunum, and ileum.
 - Large Intestine (Cecum and Colon)** ? Responsible for water absorption and feces formation. The cecum is prominent in rabbits, aiding in fermentation of fibrous materials.
 - Liver** ? Situated just below the diaphragm on the right side, the liver produces bile and processes nutrients.
 - Pancreas** ? Located near the stomach, it produces digestive enzymes and insulin.
 - Rectum and Anus** ? End of the digestive tract, responsible for expelling feces.
- 2. Respiratory System** The respiratory system supplies oxygen to the blood and removes carbon dioxide. Key organs include:
 - Lungs** ? Paired organs situated on either side of the thoracic cavity, responsible for gas exchange.
 - Trachea** ? The windpipe, a tubular structure that conducts air from the larynx to the lungs.
 - Larynx** ? Located at the top of the trachea, involved in voice production.
- 3. Circulatory System** This system circulates blood, nutrients, and gases throughout the body. Major components include:
 - Heart** ? Located centrally within the thoracic cavity, slightly to the left, it pumps blood through the arteries and veins.
 - Aorta** ? The main artery emerging from the heart, distributing oxygenated blood to the body.
 - Vena Cava** ? Large veins (superior and inferior) that return deoxygenated blood to the heart.
 - Blood Vessels** ? Including arteries, veins, and capillaries, which are distributed throughout the body.
- 4. Reproductive System** Reproductive organs vary between male and female rabbits.
 - In females:**
 - Ovaries** ? Small, oval structures located near the kidneys.
 - Oviducts** ? Tubes connecting the ovaries to the uterus.
 - Uterus** ? Located centrally in the pelvis, where developing embryos reside.
 - Vagina** ? The passage leading to the outside of the body.
 - In males:**
 - Testes** ? Located within the scrotal sacs outside the body or near the inguinal region.
 - Vas Deferens** ? Tubes transporting sperm from testes to the urethra.
 - Penis** ? External organ involved in copulation.
- 5. Excretory System** The excretory system removes waste

products from the body: Kidneys ? Bean-shaped organs located near the dorsal body wall, responsible for filtering blood. Ureters ? Tubes that carry urine from kidneys to the bladder. Bladder ? Stores urine before excretion. Urethra ? Duct through which urine exits the body.

6. Nervous System Components

The nervous system controls bodily functions: Brain ? Encased within the skull, controlling sensory processing, motor functions, and coordination. Spinal Cord ? Extends from the brain down the vertebral column, transmitting nerve signals. Nerves ? Peripheral nerves branch out to innervate various organs and tissues.
